MiniHip™ is the ideal solution for many of your active patients.

Preserving natural anatomy and restoring patient biomechanics

MiniHip™ is the ideal solution for many of your active patients.
Ideal for minimally invasive procedures

More than 10 years of implantations and numerous published scientific articles support the performance of the MiniHip™ system¹.

MiniHip™ has the capacity to conserve more bone and promote natural physiological loading when compared to other stems in the market².

Although suitable for all approaches, the MiniHip™ specific stem shape allows it to be implanted via the Direct Anterior Approach and be less invasive to soft tissues³.

With clinically proven results, MiniHip™ enables the restoration of multiple anatomies and is an ideal solution for active patients²,⁴.
